2. Creating "Convert HTML to PDF" application.....	5

1. Preparing environment

In order to build multi-platform applications using .NET on Linux, the first steps are for installing in our Linux machine the required tools.

We need to install .NET SDK from Microsoft and to allow us to develop easier, we will install an advance editor with a lot of features, Visual Studio Code from Microsoft.

Both installations are very easy and the detailed description can be found by these two links:

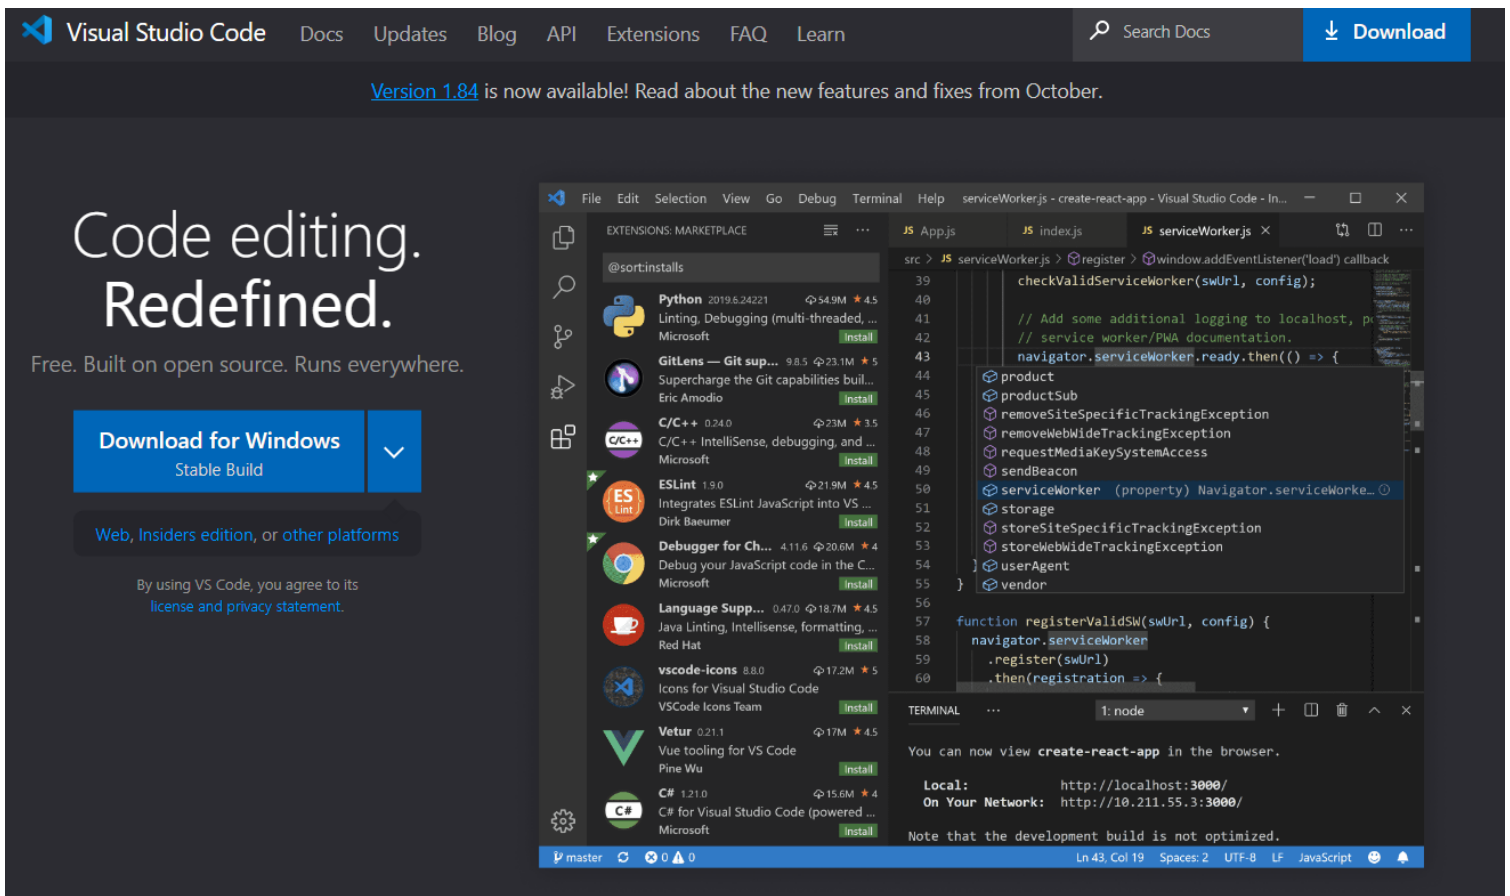

[Install .NET SDK for Linux.](#)

[Install VS Code for Linux.](#)

Once installed VS Code, you need to install a C# extension to facilitate us to code and debugging:

Install [C# extension](#).

1.1. Check the installed Fonts availability

Check that the directory with fonts `"/usr/share/fonts/truetype"` is exist. Also check that it contains `*.ttf` files.

If you don't see this folder, you may install "Microsoft TrueType core fonts" using terminal and command:

```
$ sudo apt install ttf-mscorefonts-installer
```

```
linuxconfig@linuxconfig-org: ~  
All done, no errors.  
Extracting cabinet: /var/lib/update-notifier/package-data-downloads/partial/verdan32.exe  
  extracting fontinst.exe  
  extracting fontinst.inf  
  extracting Verdanab.TTF  
  extracting Verdanai.TTF  
  extracting Verdanz.TTF  
  extracting Verdana.TTF  
  
All done, no errors.  
Extracting cabinet: /var/lib/update-notifier/package-data-downloads/partial/webdin32.exe  
  extracting fontinst.exe  
  extracting Webdings.TTF  
  extracting fontinst.inf  
  extracting Licen.TXT  
  
All done, no errors.  
All fonts downloaded and installed.  
Processing triggers for man-db (2.9.0-2) ...  
Processing triggers for fontconfig (2.13.1-2ubuntu2) ...  
linuxconfig@linuxconfig-org:~$
```

Read more about [TrueType Fonts and "How to install Microsoft fonts, How to update fonts cache files, How to confirm new fonts installation"](#).

In next paragraphs we will explain in detail how to create simple console application. All of them are based on this VS Code guide:

[Get Started with C# and Visual Studio Code](#)

Not only is possible to create .NET applications that will run on Linux using Linux as a developing platform. It is also possible to create it using a Windows machine and any modern Visual Studio version, as Microsoft Visual Studio Community 2022.

2. Creating “Convert HTML to PDF” application

Create a new folder in your Linux machine with the name **HTML to PDF**.

For example, let’s create the folder “**HTML to PDF**” on Desktop (Right click-> New Folder):

Open VS Code and click in the menu **File->Open Folder**. From the dialog, open the folder you’ve created previously:

Now, open the integrated console – the Terminal: follow to the menu **Terminal -> New Terminal** (or press Ctrl+Shift+’):

Create a new console application, using **dotnet** command.

Type this command in the Terminal console: **dotnet new console**

```
● alex@Linux2:~/Documents/HTML to PDF$ dotnet new console
The template "Console App" was created successfully.

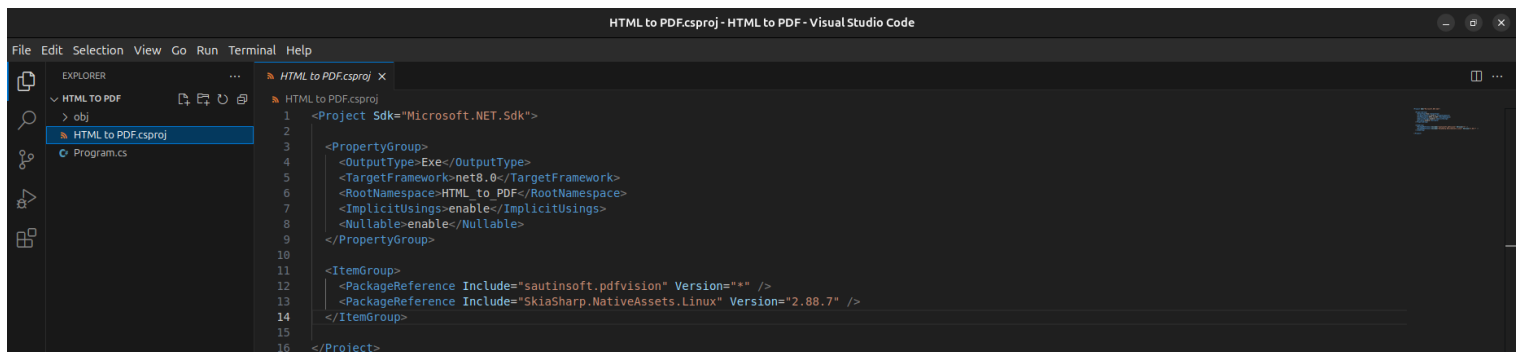

Processing post-creation actions...
Restoring /home/alex/Documents/HTML to PDF/HTML to PDF.csproj:
  Determining projects to restore...
  Restored /home/alex/Documents/HTML to PDF/HTML to PDF.csproj (in 9.72 sec).
Restore succeeded.

○ alex@Linux2:~/Documents/HTML to PDF$
```

Now we are going to modify this simple application into an application that will convert a HTML file to a PDF file.

First of all, we need to add the package reference to the **sautinsoft.pdfvision** assembly using Nuget.

In order to do it, follow to the **Explorer** and open project file "**pdf to docx.csproj**":

Add these lines into the file "**HTML to PDF.csproj**":

```
<ItemGroup>
  <PackageReference Include="sautinsoft.pdfvision" Version="*" />
  <PackageReference Include="SkiaSharp.NativeAssets.Linux" Version="2.88.7" />
</ItemGroup>
```

The first reference installs the latest version **sautinsoft.pdfvision** package from Nuget.

The second reference installs the **SkiaSharp.NativeAssets.Linux** package, which adds 2D graphics to .Net applications for Linux.

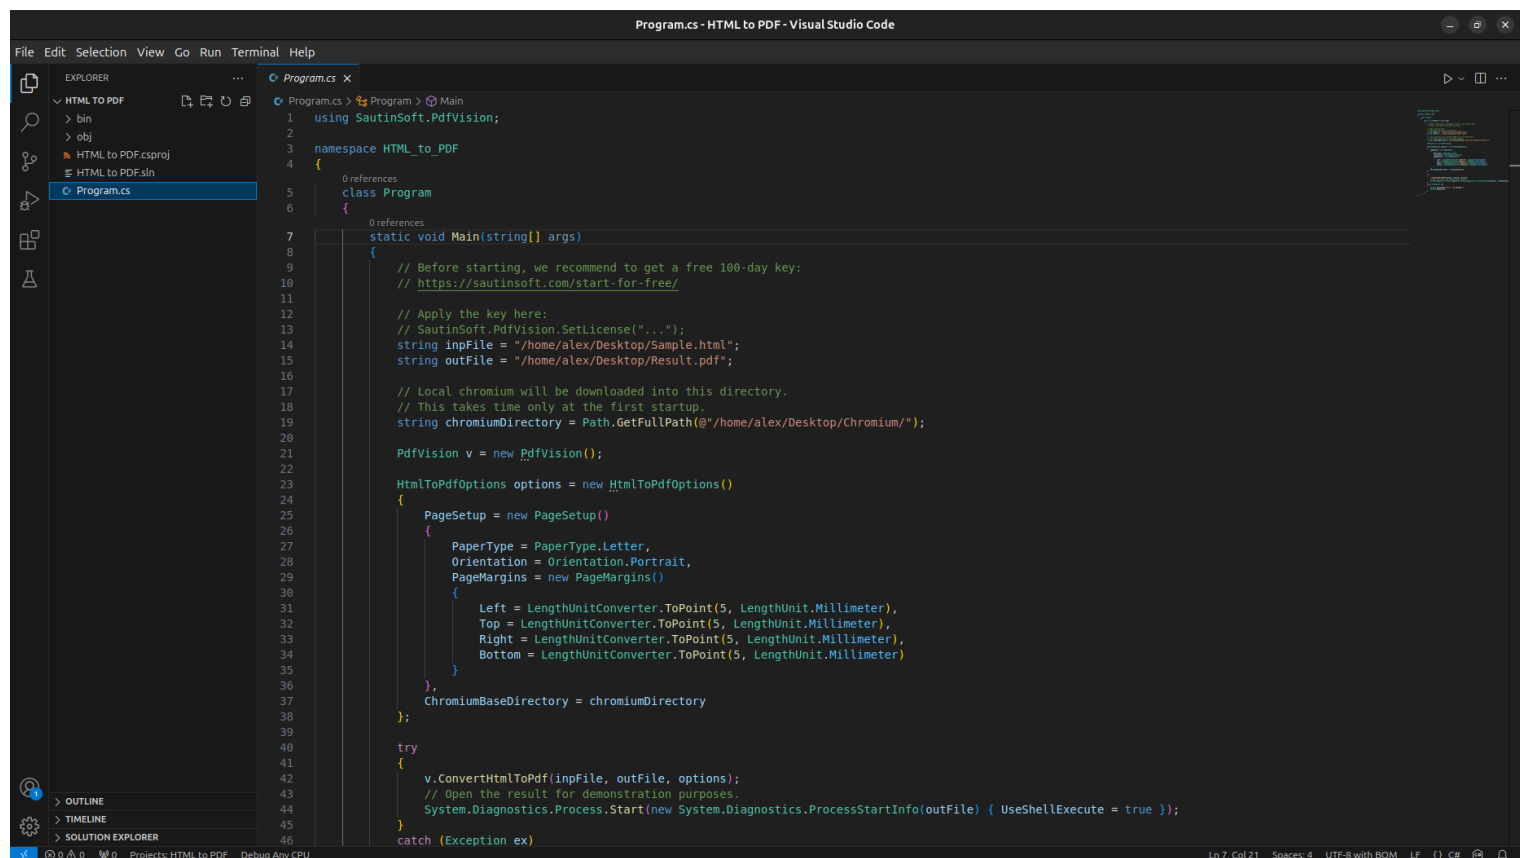

At once as we've added the package references, we have to save the "**HTML to PDF.csproj**" and restore the added packages.

Follow to the **Terminal** and type the command: **dotnet restore**

```
● alex@Linux2:~/Documents/HTML to PDF$ dotnet restore
Determining projects to restore...
Restored /home/alex/Documents/HTML to PDF/HTML to PDF.csproj (in 14.66 sec).
○ alex@Linux2:~/Documents/HTML to PDF$
```

Good, now our application has all the references and we can write the code to convert HTML to PDF.

Follow to the **Explorer**, open the **Program.cs**, remove all the code and type the new:

The code:

```
using SautinSoft.PdfVision;
```

```
namespace HTML_to_PDF
```

```
{
    class Program
    {
        static void Main(string[] args)
        {
```

```
            // Before starting, we recommend to get a free 100-day key:
            // https://sautinsoft.com/start-for-free/
```

```

// Apply the key here:
// SautinSoft.PdfVision.SetLicense("...");
string inFile = "/home/alex/Desktop/Sample.html";
string outFile = "/home/alex/Desktop/Result.pdf";

// Local chromium will be downloaded into this directory.
// This takes time only at the first startup.
string chromiumDirectory = Path.GetFullPath(@"home/alex/Desktop/Chromium/");

PdfVision v = new PdfVision();

HtmlToPdfOptions options = new HtmlToPdfOptions()
{
    PageSetup = new PageSetup()
    {
        PaperType = PaperType.Letter,
        Orientation = Orientation.Portrait,
        PageMargins = new PageMargins()
        {
            Left = LengthUnitConverter.ToPoint(5, LengthUnit.Millimeter),
            Top = LengthUnitConverter.ToPoint(5, LengthUnit.Millimeter),
            Right = LengthUnitConverter.ToPoint(5, LengthUnit.Millimeter),
            Bottom = LengthUnitConverter.ToPoint(5, LengthUnit.Millimeter)
        }
    },
    ChromiumBaseDirectory = chromiumDirectory
};

try
{
    v.ConvertHtmlToPdf(inFile, outFile, options);
    // Open the result for demonstration purposes.
    System.Diagnostics.Process.Start(new
        System.Diagnostics.ProcessStartInfo(outFile) { UseShellExecute = true });
}
catch (Exception ex)
{
    Console.WriteLine($"Error: {ex.Message}");
    Console.ReadLine();
}
}
}

```

To make tests, we need an input HTML document. For our tests, let's place a HTML file with the name "Sample.html" at the Desktop.

If we open this file in the default HTML browser, we'll see its contents:

Welcome to SautinSoft!

This is «PDF Vision .Net» sample

Subtitle

This rich text document content serves as basis for trying out various rich text formatting.

Header 1

Bold *italic* underlined ~~strikethrough~~ N_{subscript} N^{superscript}

Sub header 1.1

Fonts:

Times new roman

Arial

Launch our application and convert the "Sample.html" into "Result.pdf", type the command: ***dotnet run***

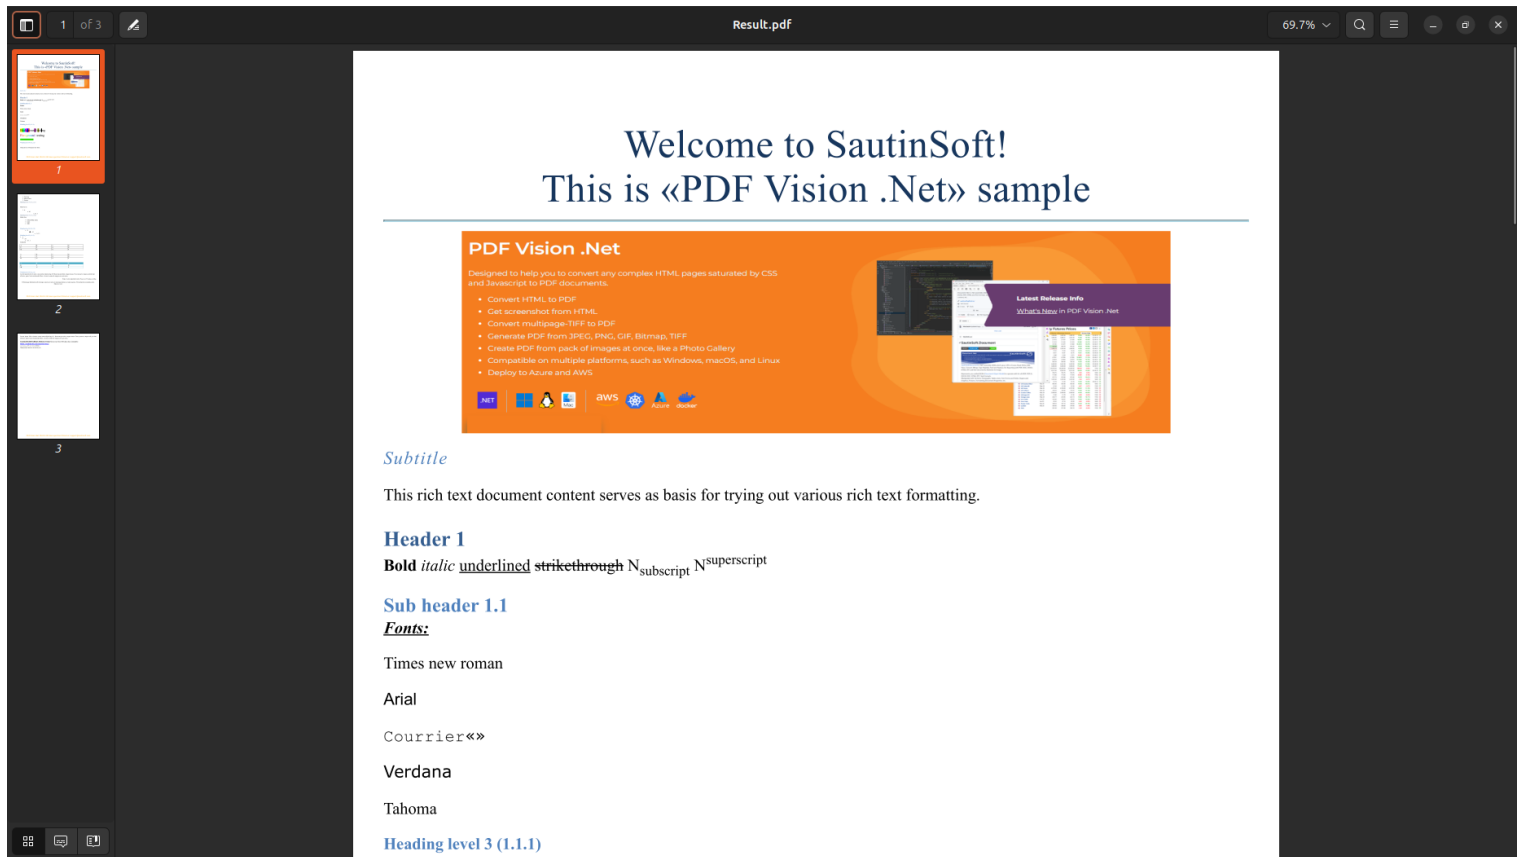

```
alex@Linux2:~/Documents/HTML to PDF$ dotnet run
alex@Linux2:~/Documents/HTML to PDF$
```

If you don't see any exceptions, everything is fine and we can check the result produced by the [PDF Vision .Net](#) library.

The new file "Result.pdf" has to appear on the Desktop:

If we open this file in the default PDF Viewer, we'll see its contents:

Well done! You have created the “HTML to PDF” application under Linux!

If you have any troubles or need extra code, or help, don't hesitate to ask our SautinSoft Team at support@sautinsoft.com!
